## Accessibility Audit Report

### Report Date:

May 7, 2026

### Evaluation Methods Used:

To measure compliance with WCAG 2.2 guidelines, testing was performed on the YourWebsite.com website. Testing involves measuring whether or not the elements and content that make up a webpage reflect the success criterion from the WCAG 2.2 checklist.

Success Criteria are the specific components that a webpage must adhere to succeed for each of the criteria mentioned. The website was tested with two methods:

#### Automated Testing:

An automated tool is usually a web browser add-on that generates a report when the user submits a webpage address. Such a report would contain a list of errors. For example, a page might have three images that are missing alt-text. Many automated tools were considered for testing websites' accessibility. The tools include Monsido, WAVE, and Google Lighthouse.

Please Note: automated testing is effective at detecting some but not all types of accessibility barriers.

#### Manual Testing:

Manual testing entails a person visiting the website using assistive technology and manually testing it by going through the contents to find accessibility barriers. For example, a user might report that a page has a pop-up dialogue that is not made available to assistive technology and keyboard users.

Manual testing included using a combination of assistive technologies, web browsers, and operating systems. The tools include NVDA, VoiceOver, and JAWS.
